

## **Electrolyzed Plus Concentrate**

Clustered Water is a specifically structured form of water found to be instrumental in key cellular functions of the human body. The molecular structure of this biological water—unlike rain, mineral or tap water—has the particular characteristic that helps it to pass freely through cell walls. This characteristic assists in, delivering nutrients, improving cellular functions, enhancing cell regeneration, hydrating cells, and helping to detoxify cells and tissues. Studies show that Structured Water helps to detoxify and open your cells, enabling your body to hydrate much more efficiently than it can with tap or bottle water.

Water clusters are found in high concentration in our young cells. . . in fact a newborn baby's body contains 100% clustered water. As we age, the clusters destabilize and often become bound to free radicals and other internal pollutants. At age 36, average water clusters drops to only 56% and by age 58, water clusters in the body can be as low as 23%. This is significant because even a 2% loss of water within our cells can damage our cells and decrease energy levels by as much as 20%.

Clustered Water, when looked at under a microscope, exhibits a beautiful hexagonally (six sided) shaped water molecule. It is made up of six H<sub>2</sub>O molecules held together by shared hydrogen atoms. Clustered Water can occur naturally and is said to be the most perfect and pure water found on earth.
